

# getCRUCLdata: Download and Use CRU CL2.0 Climatology Data in R

30 January 2017

## Summary

The `getCRUCLdata` package provides four functions that automate importing CRU CL2.0 climatology data (New et al. 2002) into R (R Core Team 2016), facilitates the calculation of minimum temperature and maximum temperature, and formats the data into a tidy data frame (Wickham 2014) or a list of raster stack objects (Hijmans 2016) for use in R or easily exports to a raster format file for use in a geographic information system (GIS). Two functions, `get_CRU_df` and `get_CRU_stack` provide the ability to easily download CRU CL2.0 data from the CRU website and import the data into R. The other two functions `create_CRU_df` and `create_CRU_stack` allow the user to easily import the CRU data files from a local disk location and transform them into a tidy data frame or raster stack. The data have applications in applied climatology, biogeochemical modelling, hydrology and agricultural meteorology (New et al. 2002).
